

Liang Gao received his B.S. in physics at Tsinghua University in 2005 and his Ph.D. in applied physics at Rice University in 2011. He is currently a postdoctoral research fellow at Washington University in St. Louis in the laboratory of Lihong V. Wang. His research interests include microscopy, optical design and fabrication, and biomedical imaging.

Lidai Wang received the B.A.Sc. and M.A.Sc. degrees in instrument science and technology from the Tsinghua University, Beijing, China, and received the Ph.D. degree in mechanical engineering from the University of Toronto, Ontario, Canada. His Ph.D. work was on microrobotics. He is currently working as a postdoctoral research associate in biomedical engineering at the Washington University in St Louis, Missouri, USA. His current research work focuses on photoacoustic imaging, sensing, and their biomedical applications.

Chiye Li received his B.S. in Life Sciences in 2007 from University of Science and Technology of China in Hefei, China. He is currently a Ph.D. student in Biomedical Engineering at Washington University in St. Louis. His research interests involve the application of photoacoustic imaging techniques in biological and medical study.

Alejandro Garcia-Urbe received the M.Sc. and Ph.D. degrees in electrical engineering from the Department of Electrical and Computer Engineering, Texas A&M University, College Station. He is currently a Post-Doctoral Researcher at the Optical Imaging Laboratory, Department of Biomedical Engineering, Washington University in St. Louis. His research interests include biomedical optics, micro-sensors, micro-fabrication, biomedical image analysis, pattern recognition, and digital signal processing.

Lihong V. Wang earned his PhD degree at Rice University, Houston, Texas and currently holds the Gene K. Beare Distinguished Professorship of Biomedical Engineering at Washington University in St. Louis. His laboratory invented or discovered functional photoacoustic tomography, dark-field confocal photoacoustic microscopy (PAM), optical-resolution PAM, photoacoustic Doppler effect, photoacoustic reporter gene imaging, focused scanning microwave-induced thermoacoustic tomography, the universal photoacoustic or thermoacoustic reconstruction algorithm, frequency-swept ultrasound-modulated optical tomography, time-reversed ultrasonically encoded (TRUE) optical focusing, sonoluminescence tomography, Mueller-matrix optical coherence tomography, optical coherence computed tomography, and oblique-incidence reflectometry.
